

Introduction to MySQL

Outline

- Introduction to MySQL
- Connecting and Disconnecting
- Entering Basic Queries
- Creating and Using a Database

Introduction to Mysql

MySQL

- MySQL is a very popular, open source DBMS
- MySQL databases are relational
- Officially pronounced “my Ess Que Ell” (not my sequel).
- **Handles very large databases;**
- **very fast performance; reliable.**
- MySQL is compatible with standard SQL
- Why are we using MySQL?
 - Free (much cheaper than Oracle!)
 - Each student can install MySQL locally.
 - Multi-user access to a number of databases offered
 - Easy to use Shell for creating tables, querying tables, etc.
 - Easy to use with Java JDBC
 - MySQL is frequently used by PHP and Perl
 - Commercial version of MySQL is also provided (including technical support)

MySQL Products Overview

MySQL Server

- Community Server
- Enterprise Server
- Embedded Server
- Cluster (Standard and Carrier-Grade)

MySQL GUI Tools

- Query Browser
- Administrator
- Migration Toolkit
- Visual Studio Plug-in
- MySQL Workbench (**New!**)

MySQL Drivers

- JDBC
- ODBC
- .NET
- PHP

Resources

- General starting point
 - > <http://www.mysql.com/>
- Developer focused
 - > <http://dev.mysql.com/>

Installing MySQL

MySQL: Installation

Instruction available at MySQL
tutorial available at

<http://dev.mysql.com/doc/refman/5.7/en/tutorial.html>

Connecting and Disconnecting to/from MySQL

Conventions

- commands meant to be executed from within a particular, for example, `shell>`
 - `root-shell>` is similar but should be executed as root
- `mysql>` indicates a statement that has to be executed from the mysql client program
- SQL keywords are not case sensitive

Connecting to MySQL

- MySQL provides an interactive shell for creating tables, inserting data, etc.
- On Windows, just go to `c:\mysql\bin`, and type:
 - `Mysql` or
 - `mysql -u user -p`;
- Or, click on the Windows icon

Sample Session

- For example:

```
Enter password:  *****
```

```
Welcome to the MySQL monitor.  Commands end with ; or \g.
```

```
Your MySQL connection id is 241 to server version: 3.23.49
```

```
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.
```

```
mysql>
```

- To exit the MySQL Shell, just type QUIT or EXIT:

```
mysql> QUIT
```

```
mysql> exit
```

Connecting to MySQL

How to use the mysql client

- **mysql** is an interactive program that enables you to:
 - connect to a MySQL server,
 - Run queries,
 - view the results
- mysql may also be used in batch mode:
 - *place your queries in a file beforehand*, then tell mysql to execute the contents of the file
- To see a list of options provided by mysql
 - shell> mysql --help

Entering & Editing commands

- Prompt mysql>
 - issue a command
 - Mysql sends it to the server for execution
 - displays the results
 - prints another mysql>
- a command could span multiple lines
- A command normally consists of SQL statement **followed by a semicolon**

MySQL commands

- help \h
- Quit/exit \q
- Cancel the command \c
- Change database use
- ...etc

Basic Queries

- Once logged in, you can try some simple queries.
- For example:

```
mysql> SELECT VERSION() , CURRENT_DATE;  
+-----+-----+  
| VERSION() | CURRENT_DATE |  
+-----+-----+  
| 3.23.49   | 2002-05-26   |  
+-----+-----+  
1 row in set (0.00 sec)
```

- Note that most MySQL commands end with a semicolon (;)
- MySQL returns the total number of rows found, and the total time to execute the query.

Basic Queries

- Keywords may be entered in any lettercase.
- The following queries are equivalent:

```
mysql> SELECT VERSION() , CURRENT_DATE;  
mysql> select version() , current_date;  
mysql> SeLeCt vErSiOn() , current_DATE;
```

Basic Queries

- Here's another query. It demonstrates that you can use mysql as a simple calculator:

```
mysql> SELECT SIN(PI()/4), (4+1)*5;  
+-----+-----+  
| SIN(PI()/4) | (4+1)*5 |  
+-----+-----+  
|      0.707107 |      25 |  
+-----+-----+
```

Basic Queries

- You can also enter multiple statements on a single line. Just end each one with a semicolon:

```
mysql> SELECT VERSION() ; SELECT NOW() ;
```

```
+-----+
| VERSION()      |
+-----+
| 3.22.20a-log   |
+-----+
+-----+
| NOW()          |
+-----+
| 2004 00:15:33  |
+-----+
```

Multi-Line Commands

- **mysql** determines where your statement ends by looking for the terminating semicolon, not by looking for the end of the input line.
- Here's a simple multiple-line statement:

```
mysql> SELECT  
      -> USER()  
      -> ,  
      -> CURRENT_DATE;
```

```
+-----+-----+  
| USER()                | CURRENT_DATE |  
+-----+-----+  
| joesmith@localhost    | 1999-03-18   |  
+-----+-----+
```

Command prompt

prompt	meaning
mysql>	Ready for new command.
->	Waiting for next line of multiple-line command.
'>	Waiting for next line, waiting for completion of a string that began with a single quote ("').
">	Waiting for next line, waiting for completion of a string that began with a double quote ("").
`>	Waiting for next line, waiting for completion of an identifier that began with a backtick ("`").
/*>	Waiting for next line, waiting for completion of a comment that began with /*.

Canceling a Command

- If you decide you don't want to execute a command that you are in the process of entering, **cancel it by typing \c**

```
mysql> SELECT  
      -> USER()  
      -> \c  
mysql>
```

Creating, Removing and Getting Information for a Database

Info about databases and tables

- Listing the databases on the MySQL server host
 - `mysql>show databases;`
- Access/change database
 - `mysql>Use [database_name]`
- Showing the current selected database
 - `mysql> select database();`
- Showing tables in the current database
 - `mysql>show tables;`
- Showing the structure of a table
 - `mysql> describe [table_name];`

Using a Database

- To get started on your own database, first **check which databases currently exist**.
- Use the SHOW statement to find out which databases currently exist on the server (and for which the user has privileges):

```
mysql> show databases;
+-----+
| Database |
+-----+
| mysql    |
| test     |
+-----+
2 rows in set (0.01 sec)
```

Using a Database

View Users (Before MySQL 5.7.6)

- `mysql> SELECT User, Host, Password
FROM mysql.user;`

Changing password for a user

- After 5.7.6, use SET PASSWORD
 - `mysql> ALTER USER user IDENTIFIED BY
'new_password';`
 - Ex.: `ALTER USER 'root'@'localhost'
IDENTIFIED BY 'new_password';`
- Before 5.7.6, use SET PASSWORD:
 - `mysql> SET PASSWORD FOR user =
PASSWORD('new_password');`

Using a Databases

Create a user

- `mysql> CREATE USER user
[IDENTIFIED BY 'new-password'];`
- See “help CREATE USER”

Remove a user

- `mysql> DROP USER user;`

Using a Database

- To create a new database, issue the “create database” command:
 - `mysql> create database webdb;`
 - Note: Database names are case sensitive
- To the select a database, issue the “use” command:
 - `mysql> use webdb;`
- To see what database is selected
 - `mysql> select database();`

Creating a Table

- Once you have selected a database, you can view all database tables:

```
mysql> show tables;
```

```
Empty set (0.02 sec)
```

- An empty set indicates that I have not created any tables yet.

Creating a Table

- **Let's create a table** for storing pets.

- Table: pets

➤ name: VARCHAR(20)

➤ owner: VARCHAR(20)

➤ species: VARCHAR(20)

➤ sex: CHAR(1)

➤ birth: DATE

➤ date: DATE

VARCHAR
is
usually
used to
store string
data.

Creating a Table

- To create a table, use the CREATE TABLE command:

```
mysql> CREATE TABLE pet (  
    -> name VARCHAR(20) ,  
    -> owner VARCHAR(20) ,  
    -> species VARCHAR(20) ,  
    -> sex CHAR(1) ,  
    -> birth DATE, death DATE) ;  
Query OK, 0 rows affected (0.04 sec)
```

Showing Tables

- To verify that the table has been created:

```
mysql> show tables;
```

```
+-----+
```

```
| Tables_in_test |
```

```
+-----+
```

```
| pet            |
```

```
+-----+
```

```
1 row in set (0.01 sec)
```

Describing Tables

- To view a table structure, use the DESCRIBE command:

```
mysql> describe pet;
```

Field	Type	Null	Key	Default	Extra
name	varchar(20)	YES		NULL	
owner	varchar(20)	YES		NULL	
species	varchar(20)	YES		NULL	
sex	char(1)	YES		NULL	
birth	date	YES		NULL	
death	date	YES		NULL	

```
6 rows in set (0.02 sec)
```

Deleting a Table

- To delete an entire table, use the DROP TABLE command:

```
mysql> drop table pet;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Loading Data

- Use the INSERT statement to enter data into a table.
- For example:

```
INSERT INTO pet VALUES  
    ('Puffball','Diane','hamster','f',  
    '1999-03-30',NULL);
```

- The next slide shows a full set of sample data.

More data...

name	owner	species	sex	birth	death
Fluffy	Harold	cat	f	1993-02-04	
Claws	Gwen	cat	m	1994-03-17	
Buffy	Harold	dog	f	1989-05-13	
Fang	Benny	dog	m	1990-08-27	
Bowser	Diane	dog	m	1998-08-31	1995-07-29
Chirpy	Gwen	bird	f	1998-09-11	
Whistler	Gwen	bird		1997-12-09	
Slim	Benny	snake	m	1996-04-29	

Loading Sample Data

- You could create a text file `pet.txt' containing one record per line.
- Values must be separated by tabs, and given in the order in which the columns were listed in the CREATE TABLE statement.
- Then load the data via the LOAD DATA Command.

Sample Data File

Fluffy	Harold	cat	f	1993-02-04	\N
Claws	Gwen	cat	m	1994-03-17	\N
Buffy	Harold	dog	f	1989-05-13	\N
Fang	Benny	dog	m	1990-08-27	\N
Bows	Diane	dog	m	1979-08-31	1995-07-29

To Load pet.txt:

Chirpy	Gwen	bird	f	1998-09-11	\N
Whistler	Gwen	bird	\N	1997-12-09	\N

```
mysql> LOAD DATA LOCAL INFILE "pet.txt"
INTO TABLE pet;
```

For each of the examples
assume the following set of data.

name	owner	species	sex	birth	death
Fluffy	Harold	cat	f	1993-02-04	
Claws	Gwen	cat	m	1994-03-17	
Buffy	Harold	dog	f	1989-05-13	
Fang	Benny	dog	m	1990-08-27	
Bowser	Diane	dog	m	1998-08-31	1995-07-29
Chirpy	Gwen	bird	f	1998-09-11	
Whistler	Gwen	bird		1997-12-09	
Slim	Benny	snake	m	1996-04-29	

Manipulating Instances of Tables of a Database

Manipulating Table Instances

- **Remove records** of a table

- `mysql> DELETE FROM tableName;`
 - `[WHERE where_condition];`

- **Update records** of a table

- `UPDATE pet SET birth`
`= '1989- 08-31'`
`WHERE name = 'Bowser';`

Querying Tables of a Database

SQL Select

- The SELECT statement is used to pull information from a table.
- The general format is:

```
SELECT what_to_select  
FROM which_table  
WHERE conditions_to_satisfy
```

Selecting All Data

- The simplest form of SELECT retrieves everything from a table

```
mysql> select * from pet;
```

name	owner	species	sex	birth	death
Fluffy	Harold	cat	f	1999-02-04	NULL
Claws	Gwen	cat	f	1994-03-17	NULL
Buffy	Harold	dog	f	1989-05-13	NULL
Fang	Benny	dog	m	1999-08-27	NULL
Bowser	Diane	dog	m	1998-08-31	1995-07-29
Chirpy	Gwen	bird	f	1998-09-11	NULL
Whistler	Gwen	bird		1997-12-09	NULL
Slim	Benny	snake	m	1996-04-29	NULL

```
8 rows in set (0.00 sec)
```

Selecting Particular Rows

- You can select only particular rows from your table.
- For example, if you want to verify the change that you made to Bowser's birth date, select Bowser's record like this:

```
mysql> SELECT * FROM pet WHERE name = "Bowser";
```

```
+-----+-----+-----+-----+-----+-----+
| name   | owner | species | sex  | birth      | death      |
+-----+-----+-----+-----+-----+-----+
| Bowser | Diane | dog      | m    | 1998-08-31 | 1995-07-29 |
+-----+-----+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

Try the same select:

- without the last (“)
- without the last (“) and (;
- Try with \c

Selecting Particular Rows

- To find all animals born after 1998

```
SELECT * FROM pet WHERE birth >= "1998-1-1";
```

- To find all female dogs, use a logical AND

```
SELECT * FROM pet WHERE species = "dog" AND sex = "f";
```

- To find all snakes or birds, use a logical OR

```
SELECT * FROM pet WHERE species = "snake" OR species  
= "bird";
```

AND has higher precedence than OR → Use paranthesis if
necessary

Selecting Particular Columns

- For having only a selection of columns of a table, just name the columns you are interested, separated by commas.
- Example: you want to know when your pets were born
 - select the name and birth columns.
- (see example next slide.)

Selecting Particular Columns

```
mysql> select name, birth from pet;
```

name	birth
Fluffy	1999-02-04
Claws	1994-03-17
Buffy	1989-05-13
Fang	1999-08-27
Bowser	1998-08-31
Chirpy	1998-09-11
Whistler	1997-12-09
Slim	1996-04-29

8 rows in set (0.01 sec)

Sorting Data

- To sort a result, use an **ORDER BY clause**.
- Example: view animal birthdays, sorted by date:

```
mysql> SELECT name, birth FROM pet ORDER BY birth;
```

```
+-----+-----+
| name      | birth      |
+-----+-----+
| Buffy      | 1989-05-13 |
| Claws      | 1994-03-17 |
| Slim       | 1996-04-29 |
| Whistler   | 1997-12-09 |
| Bowser     | 1998-08-31 |
| Chirpy     | 1998-09-11 |
| Fluffy     | 1999-02-04 |
| Fang       | 1999-08-27 |
+-----+-----+
```

```
8 rows in set (0.02 sec)
```

Sorting Data

- To sort in reverse order, add the DESC (descending keyword)

```
mysql> SELECT name, birth FROM pet ORDER BY birth DESC;
```

```
+-----+-----+
| name      | birth      |
+-----+-----+
| Fang       | 1999-08-27 |
| Fluffy     | 1999-02-04 |
| Chirpy     | 1998-09-11 |
| Bowser     | 1998-08-31 |
| Whistler   | 1997-12-09 |
| Slim       | 1996-04-29 |
| Claws      | 1994-03-17 |
| Buffy      | 1989-05-13 |
+-----+-----+
```

```
8 rows in set (0.02 sec)
```

Sorting Data

- **Sorting on multiple columns in different directions**
 - Get name, species, birth with animals in ascending order and date (within animal type) in descending order (youngest first)
 - `mysql> SELECT name, species, birth
FROM pet ORDER BY species, birth
DESC;`
 - **Try the opposite**

Selecting Particular Rows

- Find out who owns pets

```
SELECT owner FROM pet;
```

- Find out who owns pets (without duplicate)

```
SELECT DISTINCT owner FROM pet;
```

- Get birth dates for male dogs and female cats

```
SELECT name, species, birth FROM pet WHERE (species = "dog"  
AND sex="m") OR (species = "cat" AND sex="f");
```

Working with NULLs

- NULL means missing value or unknown value.
- To test for NULL, you cannot use the arithmetic comparison operators, such as =, < or <>.
- Rather, you must use the IS NULL and IS NOT NULL operators instead.

Working with NULLs

- Find all your dead pets

```
mysql> select name from pet where death  
>IS NOT NULL;
```

```
+-----+
```

```
| name |
```

```
+-----+
```

```
| Bowser |
```

```
+-----+
```

```
1 row in set (0.01 sec)
```

Working with NULLs

- Two NULL values are regarded as equal in a GROUP BY
 - Ex.: create a query with a group by on an attribute haing NULL values
- NULL values are presented:
 - first with ORDER BY ... ASC
 - last with ORDER BY ... DESC

Pattern Matching

- MySQL provides:
 - standard SQL pattern matching
 - regular expression pattern matching
- SQL Pattern matching:
 - To perform pattern matching, use the **LIKE** or **NOT LIKE** comparison operators
 - By default, patterns are case insensitive
- Special Characters:
 - _ Used to match any single character.
 - % Used to match an arbitrary number of characters.

Pattern Matching Example

- To find names beginning with 'b':

```
mysql> SELECT * FROM pet WHERE name LIKE "b%";
```

name	owner	species	sex	birth	death
Buffy	Harold	dog	f	1989-05-13	NULL
Bowser	Diane	dog	m	1989-08-31	1995-07-29

Pattern Matching Example

- Find names ending with `fy`:

```
mysql> SELECT * FROM pet WHERE name LIKE "%fy";
```

name	owner	species	sex	birth	death	
Fluffy	Harold	cat	f	1993-02-04	NULL	
Buffy	Harold	dog	f	1989-05-13	NULL	

Pattern Matching Example

- Find names containing a 'w':

```
mysql> SELECT * FROM pet WHERE name LIKE "%w%";
```

name	owner	species	sex	birth	death
Claws	Gwen	cat	m	1994-03-17	NULL
Bowser	Diane	dog	m	1989-08-31	1995-07-29
Whistler	Gwen	bird	NULL	1997-12-09	NULL

Pattern Matching Example

- Find names containing exactly five characters
 - use the `_` pattern character:

```
mysql> SELECT * FROM pet WHERE name LIKE "_____";
```

name	owner	species	sex	birth	death
Claws	Gwen	cat	m	1994-03-17	NULL
Buffy	Harold	dog	f	1989-05-13	NULL

Regular Expression Matching

- The other type of pattern matching provided by MySQL uses **extended regular expressions**.
- Testing for a match for this type of pattern, use the **REGEXP** and **NOT REGEXP** operators (or **RLIKE** and **NOT RLIKE**, which are synonyms).

Regular Expressions

- Some characteristics of extended regular expressions:
 - **“.”** matches any **single** character.
 - A character class **[...]** matches any character within the brackets.
 - Example: `[abc]` matches a, b, or c.
 - To name a range of characters, use a dash.
 - `[a-z]` matches any lowercase letter
 - `[0-9]` matches any digit.
 - **“*”** matches zero or more instances of the thing preceding it.
 - Example: `x*` matches any number of x characters
 - `[0-9]*` matches any number of digits
 - `.*` matches any number of anything.
 - To anchor a pattern so that it must match the beginning or end of the value being tested, use **^** at the beginning or **\$** at the end of the pattern.

Reg Ex Example

- Find names beginning with b,
 - use ^ to match the beginning of the name:

```
mysql> SELECT * FROM pet WHERE name REGEXP "^b";
```

+-----+-----+-----+-----+-----+-----+					
name	owner	species	sex	birth	death
+-----+-----+-----+-----+-----+-----+					
Buffy	Harold	dog	f	1989-05-13	NULL
Bowser	Diane	dog	m	1989-08-31	1995-07-29
+-----+-----+-----+-----+-----+-----+					

Reg Ex Example

- Find names ending with `fy',
 - use `\$' to match the end of the name:

```
mysql> SELECT * FROM pet WHERE name REGEXP "fy$";
```

+	+	+	+	+	+	+
	name		owner		species	
	sex		birth		death	
+	+	+	+	+	+	+
	Fluffy		Harold		cat	
	f		1993-02-04		NULL	
	Buffy		Harold		dog	
	f		1989-05-13		NULL	
+	+	+	+	+	+	+

Counting Rows

- Databases often used to answer the question,
 - "How often does a certain type of data occur in a table?"
 - Example: 1) how many pets are sored
 - 2) how many pets each owner has
- Counting the total number of animals you have is the same question as "How many rows are in the pet table?" because there is one record per pet.
- The COUNT() function counts the number of non-NULL results

Counting Rows Example

- A query to determine total number of pets:

```
mysql> SELECT COUNT(*) FROM pet;
```

```
+-----+  
| COUNT(*) |  
+-----+  
|          9 |  
+-----+
```

Counting Rows Example

- Finding how many pets each owner has:

```
mysql> SELECT owner, COUNT(*) FROM  
      pet GROUP BY owner;
```

OWNER	COUNT(*)
Benny	2
Diane	2
Gwen	3
Harold	2

Selecting Particular Rows

- Find out number of animals per species

```
SELECT species, count(*) FROM pet GROUP BY species;
```

- Find out number of animals per sex

```
SELECT sex, count(*) FROM pet GROUP BY sex;
```

- Find out number of animals per combination of species and sex

```
SELECT species, sex, count(*) FROM pet GROUP BY  
species, sex;
```

Selecting Particular Rows

- Find out number of dogs and cats per combination of species and sex

```
SELECT species, sex, count(*) FROM pet WHERE species =  
'dog' or species = 'cat' GROUP BY species, sex;
```

- Try what happens changing OR with AND
- Find out number of animals per sex only for animals whose sex is known

```
SELECT species, sex, count(*) FROM pet WHERE sex IS  
NOT NULL GROUP BY species, sex;
```

Batch Mode

- MySQL used interactively
 - to enter queries and view the results.
- MySQL can be run in batch mode.
 - put the commands you want to run in a file, then tell mysql to read its input from the file:
 - The created file is script file that is requested to be executed
- `shell> mysql < batch-file`
- `shell> mysql -t < batch-file`

Exercise 1

- Create a new DB or a table *shop* in an existing DB

```
CREATE TABLE shop (  
  article INT(4) UNSIGNED ZEROFILL DEFAULT '0000'  
    NOT NULL,  
  dealer VARCHAR(20) DEFAULT '' NOT NULL,  
  price DOUBLE(16,2) DEFAULT '0.00' NOT NULL,  
  PRIMARY KEY(article, dealer));
```

```
INSERT INTO shop VALUES
```

```
(1, 'A', 3.45) , (1, 'B', 3.99) , (2, 'A', 10.99) ,  
  (3, 'B', 1.45) ,
```

```
(3, 'C', 1.69) , (3, 'D', 1.25) , (4, 'D', 19.95)8;2
```

Exercise 1

- Find out the highest item article

```
SELECT MAX(article) AS article FROM shop;
```

- Find the article, dealer, and price of the most expensive article.

```
SELECT article, dealer, price  
FROM shop
```

```
WHERE price=(SELECT MAX(price) FROM shop);
```

```
SELECT article, dealer, price  
FROM shop
```

```
ORDER BY price DESC
```

```
LIMIT 1;
```

Exercise 1

- Find the highest price per article.

```
SELECT article, MAX(price) AS price  
FROM shop  
GROUP BY article;
```

- For each article, find the dealer(s) with the most expensive price.

```
SELECT article, dealer, price  
FROM shop s1  
WHERE price=(SELECT MAX(s2.price)  
              FROM shop s2  
              WHERE s1.article = s2.article);
```

Exercise 2

■ Create the following tables

See Sec. 3.6.9 of
the tutorial for
more details

```
CREATE TABLE person (  
  id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
  name VARCHAR(60) NOT NULL,  
  PRIMARY KEY (id) );
```

```
CREATE TABLE shirt (  
  id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
  style ENUM('t-shirt', 'polo', 'dress') NOT NULL,  
  color ENUM('red', 'blue', 'orange', 'white',  
    'black') NOT NULL,  
  owner SMALLINT UNSIGNED NOT NULL REFERENCES  
    person(id),  
  PRIMARY KEY (id) );
```

- **Populate the tables**

Exercise 2

```
INSERT INTO person VALUES (NULL, 'Antonio Paz');
```

```
SELECT @last := LAST_INSERT_ID();
```

```
INSERT INTO shirt VALUES  
(NULL, 'polo', 'blue', @last),  
(NULL, 'dress', 'white', @last),  
(NULL, 't-shirt', 'blue', @last);
```

```
INSERT INTO person VALUES (NULL, 'Lilliana  
Angelovska');
```

**See Sec. 3.6.5, 3.6.9 of the
tutorial for more details**

```
SELECT @last := LAST_INSERT_ID();
```

```
INSERT INTO shirt VALUES  
(NULL, 'dress', 'orange', @last),  
(NULL, 'polo', 'red', @last),  
(NULL, 'dress', 'blue', @last),  
(NULL, 't-shirt', 'white', @last);
```

Exercise 2

- Find out person names containing “Lilliana” as a string and having a shirt of any color but not white

```
SELECT s.*  
FROM person p INNER JOIN shirt s ON s.owner =  
    p.id  
WHERE p.name LIKE '%Lilliana%' AND s.color <>  
    'white';
```

Exercise 3

- Build the DB having the following tables

Employees

<u>Matricola</u>	Name	Age	Salary
101	Mario Rossi	34	4000
103	Mario Bianchi	23	3500
104	Luigi Neri	38	6100
105	Nico Bini	44	3800
210	Marco Celli	49	6000
231	Siro Bisi	50	6000
252	Nico Bini	44	7000
301	Sergio Rossi	34	7000
375	Mario Rossi	50	6500

Supervision

Head	<u>Employee</u>
210	101
210	103
210	104
231	105
301	210
301	231
375	252

Exercise 3: Queries

Q: Find out matriculation number, name, age, salary of the employees earning more than 4000 Euro

(Write the SQL query)

In Tuple relational calculus:

$\{ e.* \mid e(\text{Employees}) \mid e.\text{Salary} > 4000 \}$
